

Exam-style Questions

These questions refer to the **Preliminary Material** and the **Skeleton Program**, but do not require any additional programming

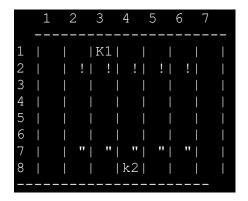

TOTAL MARKS: 60

1 This question refers to the PlayGame method in the Dastan class. The method contains a nested loop with multiple while loops inside the main game loop. (a) State the time complexity of this loop. [1] **(b)** Explain the efficiency of this time complexity and how well it scales up. [3] 2 This question refers to the entire pre-release code. Throughout the code there are many literals such as 'mirza', 'jazair', 'ryott', 'faujdar' and some others. (a) Describe one problem that could occur due to this. [2] **(b)** Describe one possible solution to this problem. [2] 3 This question refers to the private method GetPointsForOccupancyByPlayer in the Dastan class.

Explain precisely how polymorphism is used when calculating the ScoreAdjustment in this method. [3]

4 This question refers to the Main method that is executed at the start of the game.

When **ThisGame** is instantiated, currently the arguments 6, 6, 4 are passed to **Dastan**.

(a) Assume the arguments 8, 7, 5 were passed to Dastan instead.

Explain why player one's Kotla and Mirza would appear in column 3 rather than in column 4 opposite player two's as per the image above.

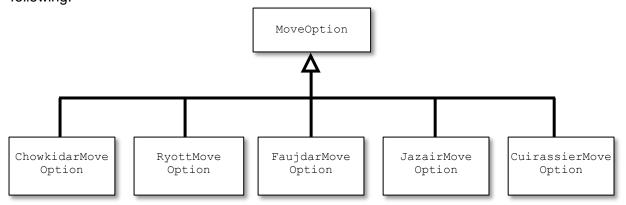

(b) Describe how the code for the CreateBoard method of the Dastan class could be modified so that where there are an odd number of columns, then the Kotlas will both appear in the central column but when there are an even number it will remain as it is.

[2]

[4]

5	This game refers to the private methods CreateRyottMoveOption, CreateFaujdarMoveOption,CreateJazairMoveOption, CreateCuirassierMoveOption and CreateChowkidarMoveOption.		
	to v	rently the methods take a Direction parameter which changes between 1 and -1 according whose turn it is. Across the methods there is a lot of repeated use of the Direction ameter which always gets multiplied by any non-zero parameter to the constructor of Move .	
	the	hout suggesting any specific code, describe alternative logic that could remove the need for Direction parameter by modifying the AddToMoveOptionQueue and dateMoveOptionQueueWithOffer methods of the Player class.	[3]
6	This question refers to the MoveOptionQueue class.		
	The game uses a queue data structure rather than a stack.		
	(a)	Explain why a queue is a more suitable data structure than a stack.	[2]
	(b)	Currently this class uses a list to store the queue data structure; explain how it could be modified to use an array to implement a circular queue with five elements.	
		You should not write any actual code for this question but refer to any new variables that may be required and create any algorithms using structured/descriptive English. Alternatively, you may produce an annotated diagram.	[4]
7	This question refers to the method GetIndexOfSquare in the Dastan class.		
	Exp	plain how the private method GetIndexOfSquare works.	[3]
8	The board is currently represented as a one-dimensional array, but there are possible alternative representations.		
	(a)	Explain how the board could be represented as a two-dimensional list or array.	[2]
	(b)	State one reason why an array is more appropriate to store the board than a list.	[1]
9	It would be possible to create a save game file for Dastan. At the start of this file would be some metadata.		
	•	plain the purpose of metadata and give one example of metadata that could be stored for stan.	[2]
10	This question refers to the CreateMoveOptions, CreateMoveOption, CreateChowkidarMoveOption, CreateRyottMoveOption, CreateFaujdarMoveOption, CreateJazairMoveOption and CreateCuirassierMoveOption methods in the Dastan class and to the MoveOption class.		
	(a)	Currently the MoveOption class holds the details for whichever move is to be made that is generated/populated by one of the CreateChowkidarMoveOption , CreateRyottMoveOption , CreateFaujdarMoveOption , CreateJazairMoveOption and CreateCuirassierMoveOption methods in the Dastan class.	
		Explain why this is NOT polymorphism.	[2]

10 (b) An alternative would have been to create and use an inheritance structure similar to the following:

Explain how this inheritance structure could have been used effectively with polymorphism. [2]

- 11 This question refers to the Kotla class.
 - (a) The constructor includes a call using MyBase; explain the purpose of this.
 - **(b)** The method **GetPointsForOccupancy** has a different implementation from the method with the same name in the parent class. State the name for this OOP technique.
 - (c) Explain what the OOP technique *overloading* is used for. [3]
- 12 The MoveOptionQueue class implements a normal queue, which is a FIFO (first in, first out) data structure.
 - Explain the different between a normal queue and a priority queue. [4]
- 13 This question refers to the constructor of the Piece class and the SetPiece method of the Square class.
 - Both methods take a parameter *P* which is unclear. Explain why variables should always have meaningful names. [2]
- 14 This question is about access levels for attributes and methods and refers to the Piece class.
 - (a) The Piece class has four protected attributes; what does the word 'protected' mean in this context?
 - **(b)** The **Piece** class has four public methods; what does the word 'public' mean in this context? [1]
 - (c) There is one final level of access for attributes and methods which is private; what does that mean? [1]
 - (d) Why is it important to have access modifiers such as private, protected and public for both methods and attributes in OOP? [3]
- 15 This question refers to the CheckSquareInBounds method of the Dastan class.
 - (a) This method uses integer division; explain the difference between integer division and floating point division. [2]
 - **(b)** This method returns a Boolean value. Describe the meaning of Boolean. [1]
